EC - type-examination certificate

Certificate no.: ABV 550/2

Notified body: TÜV Industrie Service GmbH TÜV SÜD Gruppe
(bis 31.03.2004 TÜV Süddeutschland Bau und Betrieb GmbH)
Zertifizierungsstelle für Aufzüge und Sicherheitsbauteile
Westendstraße 199, 80686 München - Germany

**Applicant/
Certificate holder:** Chr. Mayr GmbH & Co. KG
Eichenstraße 1
87665 Mauerstetten - Germany

Date of submission: 2004-12-14

Manufacturer: Chr. Mayr GmbH & Co. KG
Eichenstraße 1
87665 Mauerstetten - Germany

Product, type: Braking device acting on the traction sheave or the shaft
of the traction sheave, as part of the protection device
against overspeed for the car moving in upwards
direction, type 894.001.1 SO, Größe 8

Test Laboratory: TÜV Industrie Service GmbH
TÜV SÜD Gruppe
Abteilung Aufzüge und Sicherheitsbauteile
Westendstrasse 199, 80686 München - Germany

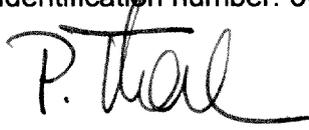

**Date and
Number of test report:** 2005-01-11
550/2

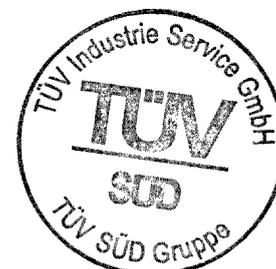

EC-directive: 95 / 16 / EC

Statement: The safety component conforms to the directive's safety
requirements for the respective scope of application
stated on page 1 - 2 of the annex to this EC type-
examination certificate.

Certificate date: 2005-01-11

Zertifizierungsstelle für Aufzüge und Sicherheitsbauteile
EC-Identification number: 0036

Peter Tkalec

Industrie Service

Annex to the EC type-examination certificate No. ABV 550/2 dated 2005-01-11

1. Scope of Application

- 1.1 Permissible brake force when the brake device acts on the brake disk while the car is moving upward 4530 N
The brake force refers to a single brake resp. brake tongs.

Unless the brake disk is an integral element of the traction sheave (e. g. cast on), it must be connected directly or indirectly with the latter via the common shaft. In cases where brake disk and traction sheave are connected indirectly via the shaft, the brake disk must be positioned in the immediate vicinity of the traction sheave.

- 1.2 Maximum tripping speed of the overspeed governor and maximum rated speed

The maximum tripping speed of the overspeed governor and the maximum rated speed of the lift must be calculated on the basis of the brake disk maximum tripping speed and maximum rated speed (gliding speed) as outlined in sections 1.2.1 and 1.2.2 taking into account brake disk diameter effectively, traction sheave diameter and car suspension.

$$v = \frac{D_{TS} \times v_{BS}}{D_{BS} \times i}$$

$v =$ Tripping (rated) speed (m/s)
 $D_{TS} =$ Diameter of the traction sheave from rope's center to rope's center (m)
 $D_{BS} =$ Diameter of the brake disk effectively (m)
 $v_{BS} =$ Gliding speed on the brake disk diameter effectively (m/s)
 $i =$ Ratio of the car suspension

- 1.2.1 Maximum tripping speed (gliding speed) on the brake disk diameter effectively 10,00 m/s
- 1.2.2 Maximum rated speed (gliding speed) on the brake disk diameter effectively 8,70 m/s

2. Conditions

- 2.1 In order to comply with the redundancy required in Section 9.10.2 of EN 81-1, at least two braking devices (single brakes, brake tongs) must be used. Where more than two braking devices are used, redundancy requirements necessitate that a sufficient braking effect as outlined in section 12.4.2.1 of EN 81.1 is still maintained if one of the braking devices fails. It is not assumed that two braking devices will fail simultaneously.

- 2.2 Since the brake device represents only a part at the protection device against overspeed for the car moving in upwards direction an overspeed governor as per EN 81-1, paragraph 9.9 must be used to monitor the upward speed and the brake device must be triggered (engaged) via the overspeed governor's electric safety device.

Alternatively, the speed may also be monitored and the brake device engaged by a device other than an overspeed governor as per paragraph 9.9 if the device shows the same safety characteristics and has been type tested.

Industrie Service

- 2.3 In order to recognise the loss of redundancy the movement of each brake circuit (each single brake) is to be monitored separately and directly (e.g. by micro switches). If a brake circuit fails to engage (close) while the lift machine is at standstill, next movement of the lift must be prevented.
- 2.4 In cases where the lift machine moves despite the brake being engaged (closed), the lift machine must stop at the next operating sequence at the latest and the next movement of the lift must be prevented (The car may, for example, be prevented from traveling or, if already moving, halted either immediately or at the next floor, by querying the position of the micro switch which is used to monitor the mechanical movement of the brake circuits, should both brake circuits fail to open).
- 2.5 If the brake disk does not form an integral part of the traction sheave (e. g. cast on), the manufacturer of the drive unit or the installation company must provide calculation evidence that the brake disk - traction sheave connection is sufficiently safe. This connection also includes the shaft if the brake disk is positioned on the common shaft in the immediate vicinity of the traction sheave.

The calculation evidence must be enclosed with the technical documentation of the lift.

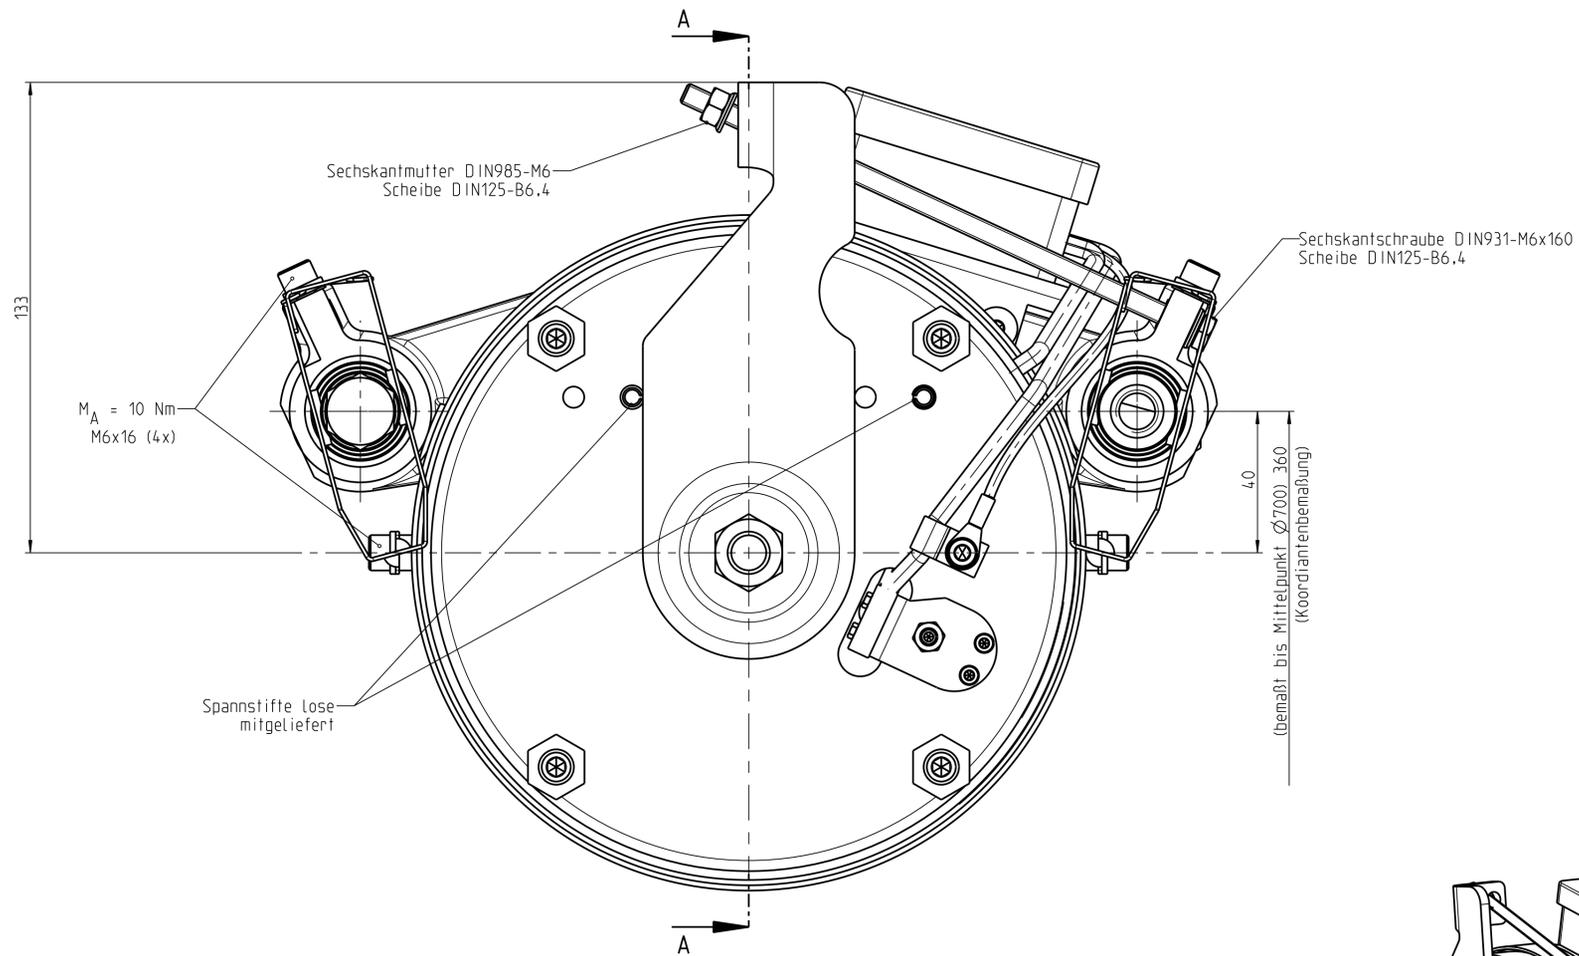

3. Remarks

- 3.1 The permissible brake force must be applied to the lift system in such a manner, that the empty car moving in upwards direction is not decelerated by more than $1g_n$.
- 3.2 In the scope of this type-examination it was found out, that the brake device also functions as a brake for normal operation, is designed as a redundant system and therefore meets the requirements to be used also as a part of the protection device against overspeed for the car moving in upwards direction.

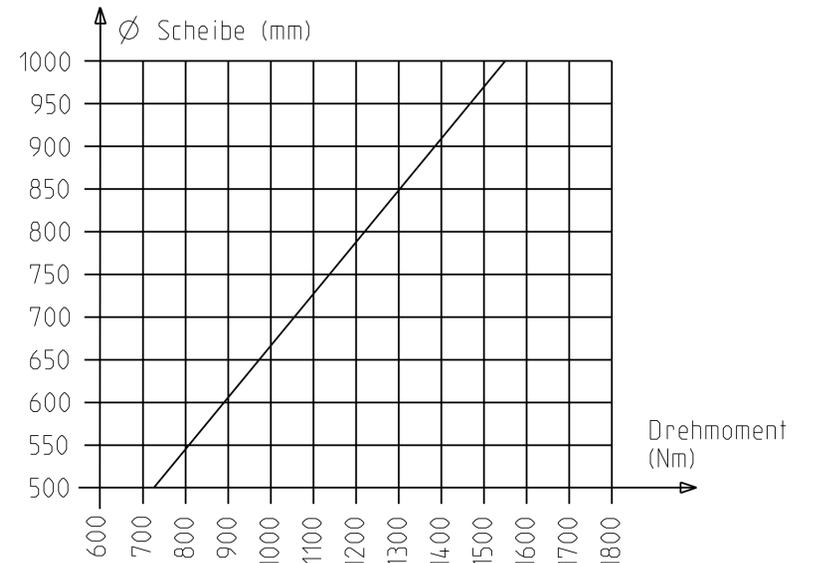

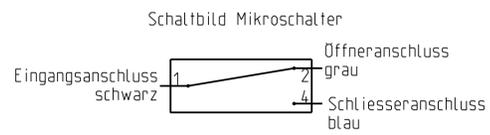

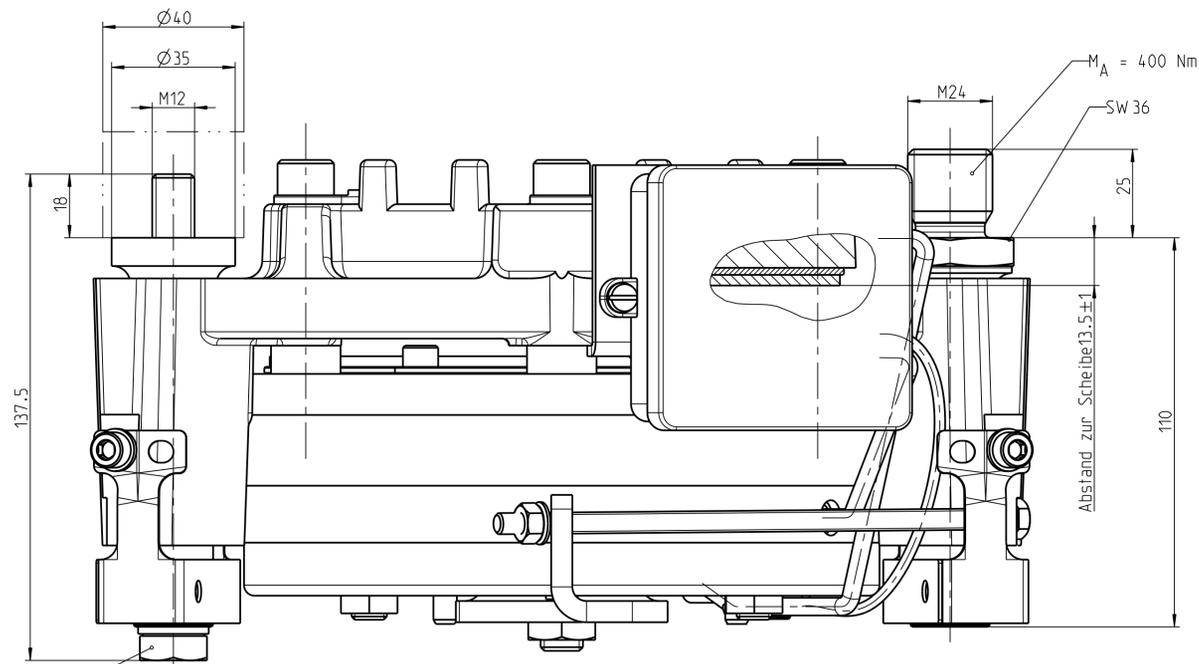

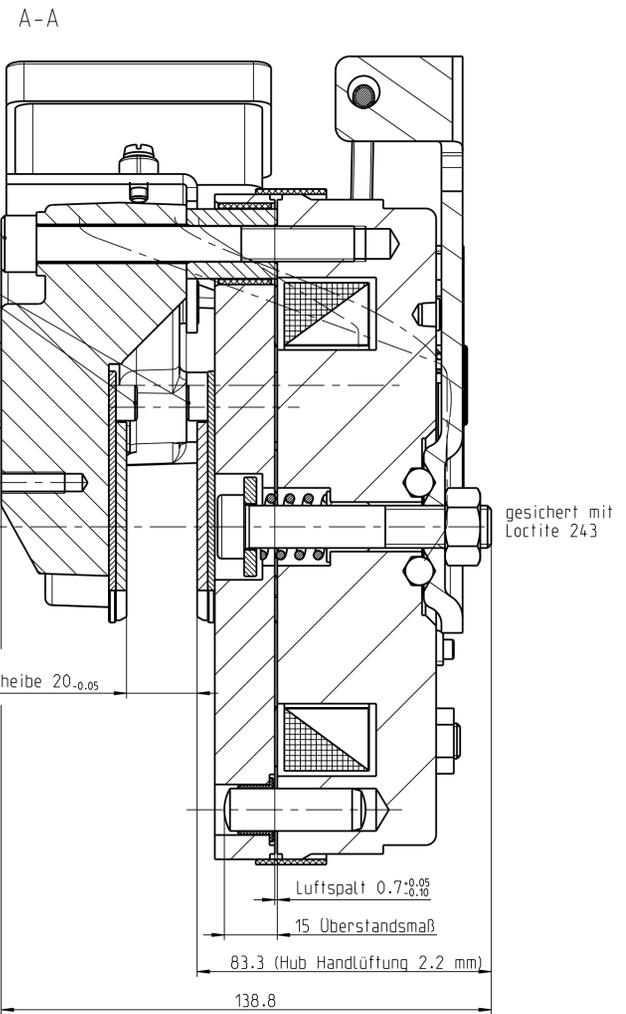

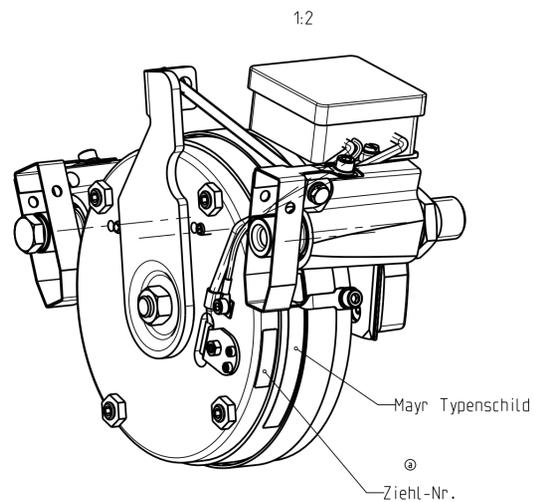

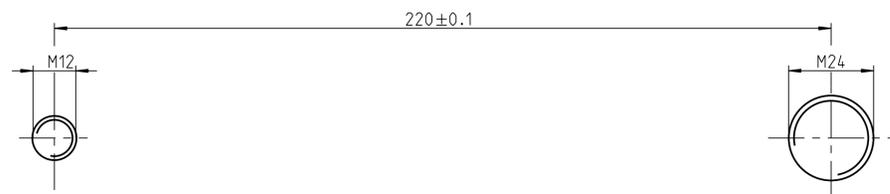

This type examination only refers to the requirements pertaining to brake devices as per EN 81-1, paragraph 9.10.

Checking whether the requirements as per paragraph 12.4 have been complied with is not part of this type examination.

- 3.3 In order to provide identification, information about the basic design and its functioning and to show which parts have been tested pertaining to the tested and approved type, drawing no. E 077 08 018 000 110 dated 20 August 2004 is to be enclosed with the EC type-examination certificate and the Annex thereto. The installation conditions and connection requirements are presented or described in separate documents (e.g. assembly and operating instructions).
- 3.4 The EC type-examination certificate may only be used in connection with the pertinent annex.
